ABSTRACT:

PROBLEM TO BE SOLVED: To provide a film causing little stress-whitening, having high surface hardness and rigidity and excellent transparency when laminated on a plastic molding or the like.

SOLUTION: This film is obtained by molding a resin composition comprising an acrylic graft copolymer and a methacrylic graft copolymer, wherein the content of acrylic ester-based rubber-like polymer is 5-20 wt.%, the average particle diameter of the acrylic ester-based rubber-like polymer is 500-2,000 Å and the relation between the average particle diameter d (Å) and the amount w

(wt.%) of crosslinking agent used in the acrylic ester-based rubber-like polymer satisfies the formula $0.002d \leq w \leq 0.005d$, the graft rate of the acrylic graft copolymer is 30-200% and the reduced viscosity of the methyl ethyl ketone- soluble of the resin composition is 0.2-0.8 dl/g.
